Von Castro

Software Engineer | Edmonton, AB (open to remote/relocation) | voncastro.dev@gmail.com | linkedin.com/in/voncastro | github.com/voncastro | voncastro.vercel.app

Software engineer shipping production Flutter + Supabase product work through AI-agent workflows — 900+ merged PRs in the last seven months as solo architect of Setlio and contributor to a launched expense app — with a 12-month Intuit platform internship behind it.

EDUCATION

MacEwan University — BSc Computer Science, Minor in Business Studies (Edmonton, AB · Graduated Nov 2023)

EXPERIENCE

Software Developer Intern — Intuit (Jan 2022 – Dec 2022)

- Led a server-side rendering performance investigation across a multi-plugin page architecture — measured up to 50% load-time improvement on targeted plugins and surfaced the compatibility blockers for general rollout.
- Built and shipped an automated on-call handoff system at a company-wide hackathon — eliminated the manual context-gathering engineers did before every shift; adopted in production by a 12-engineer team.
- Shipped a plugin-health dashboard adopted org-wide as the centralized source for plugin status, ownership, and health; earned two org-wide recognition awards, including one for related cross-team analytics-pipeline work.

Frontend Developer Intern — Cassidy eCare (Sep 2021 – Dec 2021)

- Reported directly to the founder; translated product requirements into shipped frontend features as the early MVP evolved.
- Built the React + Redux web frontend — owned component architecture, Redux store design, and backend API integration.
- Wrote the project's onboarding documentation (current state, architecture, near-term direction) so new contributors could ship in their first week.

PROJECTS

Setlio — Solo Developer (Apr 2026 – Present · offline-first Flutter fitness tracker with Wear OS companion)

- Built and ship Setlio solo — workout logging, reusable templates, calendar planning, stats, and local-first sync (Drift SQLite + Supabase): 1,209 commits across 907 self-merged PRs, used daily since April 2026.
- Engineered the hard parts at production depth — Wear OS phone-free tracking with foreground-service lifecycle, a conflict-safe outbound sync queue, mid-workout crash recovery, and GDPR-compliant account deletion with data-export archive.
- Built the engineering team into the repo: formal SPEC / standards / domain-expert contracts plus a 449-script PowerShell toolkit with 76 automated check gates (doc drift, architecture health, coverage floors, Wear sync) run locally and in CI before every merge.

dvup — Volunteer Contributor, Nolstar Studio (Mar 2026 – Present · expense-splitting app, live on the App Store and Google Play)

- Shipped an end-to-end Settle Up CSV import on the launched app: Postgres RPC migration, server-side validation, a multi-step Flutter flow, cross-currency confirmation, timezone-aware settlement dates, and split rounding that balances to the cent.
- Diagnosed and fixed multi-currency ledger correctness bugs — split-rounding bias, currency-derivation mismatch on group creation, and settlement-date timezone drift.
- Operated inside a 16-domain AI-agent workflow across 20+ tables and 40+ RPCs — scoped small diffs, briefed agents against formal SPEC contracts, and owned every merge.

SKILLS

Languages: Dart, TypeScript, JavaScript, SQL, Kotlin, Python
Frameworks: Flutter, React, Redux, Riverpod, Provider
Backend / DB: Supabase, PostgreSQL, Edge Functions, Drift (SQLite), Firebase
Tools: Git, Xcode, Android Studio, PowerShell, Gradle, Sentry
AI tooling: Claude Code, OpenAI Codex, AI-native PR workflow (formal SPEC contracts, doc-drift gates, autonomous quality passes)
