Profile

Computer Science graduate (BSc, MacEwan University) with two full-time development internships at Intuit and Cassidy eCare and current full-stack project work. Builds React/Redux web interfaces, REST API integrations and relational data layers on SQLite and Supabase/PostgreSQL, backed by automated tests, code review and scripted release checks. Self-taught Flutter/Dart, Supabase, the Wear OS Data Layer and ML Kit in 2026, using OpenAI Codex and Claude Code as tutors and co-developers under written requirements, code review and automated tests.

Technical Skills

Languages: JavaScript, TypeScript, Dart, Kotlin, SQL, Python

Web and mobile: React, Redux, HTML/CSS, Flutter, Riverpod, Android, Wear OS

Back end and data: REST APIs, Supabase (PostgreSQL, Auth, RPC), Drift/SQLite, PostgreSQL row-level security

Testing and code review: SinonJS mocks, Flutter unit/widget/golden/integration tests, Kotlin unit tests, mutation testing, strict static analysis, GitHub pull-request review

Delivery and monitoring: Git/GitHub, GitHub Actions, Jenkins, Jira, PowerShell validation and build scripts, Gradle signed Android/Wear OS builds, Sentry, PostHog

AI tooling: OpenAI Codex, Claude Code, Google ML Kit (on-device text recognition)

Professional Experience

Software Developer Intern | Intuit

January 2022 - December 2022 (full-time)

QuickBooks Online UI infrastructure team

- Built a Slack-based on-call handoff automation for a 12-engineer team during a company hackathon: pulled rotation data from Workday, PagerDuty and Jenkins through REST APIs, automated channel membership for on-duty and opt-in members, and linked documentation, unresolved threads and monitoring dashboards; adopted by the team in production and recognized with a Spotlight award.
- Worked with mentors to reconcile each tool's data-refresh timing with rotation changes so the handoff flow had the least friction, reducing manual context-gathering before shifts.
- Contributed to an exploratory server-side rendering evaluation of the QuickBooks Online dashboard home page: investigated plugin dependencies that SSR did not support, replaced or safely deferred them, and verified data integrity with browser developer tools and breakpoints.
- Wrote SinonJS unit tests for invalid inputs, missing outputs and data-fetching changes, keeping changed files above the 85% coverage threshold enforced by pull-request checks.
- Opened pull requests across other teams' plugin repositories and resolved their code-review feedback; tracked bugs and features in Jira and reported progress in stand-ups.
- Cleansed and reconciled plugin-health metadata (owners, contacts, active status, versions, dependencies) with a mentor, deduplicating stale and ownerless records for a dashboard used by multiple teams and leadership.
- Received multiple Intuit Spotlight peer-recognition awards, including for assessing design and UX on another team's prototype and for analytics-pipeline work that exposed a dataset another team needed.

Frontend Developer Intern | Cassidy eCare

September 2021 - December 2021 (full-time)

Early-stage health-tracking startup (remote)

- Built React/Redux interfaces for login, patient profiles and provider dashboards from Adobe XD mockups, with input validation, error and empty states, using mock data while the backend was in development; demonstrated to the founder's pilot-program prospects and mentors.
- Refined requirements with the non-technical founder in stand-ups as prospective-client feedback changed the MVP; when that feedback shifted the product from web to mobile, talked through the technical options with the founder, paused completed web work and prototyped a Kotlin Android login screen matching the existing design system.
- Maintained GitHub documentation and code comments covering setup, API notes and the roadmap as the source of truth for the founder and future developers.

Independent Software Project

Developer | Setlio April 2026 - Present (part-time, independent project)

Offline-first fitness tracker with a Wear OS companion; AI-assisted solo project (Flutter/Dart, Kotlin, Drift/SQLite, Supabase/PostgreSQL); private repository

- Own requirements, architecture, code review and validation for a Flutter/Dart application, using OpenAI Codex and Claude Code as co-developers under written specs, scoped tool permissions, sensitive-data redaction and untrusted-input policies; plan work as reviewable pull-request slices with dependencies, validation and rollback paths.
- Designed the local-first data layer: Drift on an encrypted SQLite database with a transactional outbox queue and batched synchronization to Supabase/PostgreSQL across 14 tables; a regression test confirms that a four-exercise, 20-set workout flushes 25 or more queued rows in four or fewer upsert requests.
- Implemented PostgreSQL row-level security with owner-scoped policies and composite ownership keys, verified by schema-audit tests of every policy and sync tests that cross-user rows are never pushed or pulled.
- Developed a native Kotlin Wear OS companion that mirrors the phone workout; after missed commands and stale rest timers in real sessions, redesigned phone-watch messaging around durable Data Layer commands with idempotent replay (duplicate-detecting receipt ledger) and timestamp-anchored timers, verified by Kotlin unit tests and on physical devices.
- Integrated Google ML Kit on-device text recognition on Android through Flutter-Kotlin platform channels so users can scan equipment weight-stack labels, with editable results and a manual-entry fallback; covered by parser and scanner-bridge unit tests, a mutation-testing gate and a physical-device reference-image test.
- Maintain 3,500+ automated Flutter tests (unit, widget, golden and integration) across authentication, routing, repositories, synchronization and responsive UI, enforced with strict static analysis, a scripted coverage floor and mutation testing (as of October 2026).
- Ran a GitHub Actions CI workflow (analysis, coverage tests, Windows golden runs) from April to June 2026, then moved to local commit-bound pull-request gates when hosted runner quota lapsed; automated signed Android and Wear OS release builds in PowerShell with apksigner certificate checks and SHA-256 build manifests.
- Instrumented Sentry error reporting and PostHog analytics behind a shared wrapper with sensitive-data scrubbing, user-controlled privacy preferences and release/build identifiers.

Volunteer Development

Volunteer Contributor | dvup (Nolstar Studio) March 2026 - Present (part-time, occasional volunteer)

Expense-splitting app live on Google Play and the App Store - Flutter, Supabase/PostgreSQL

- Guided AI-assisted implementation of a Settle Up CSV import (schema migration, server-side validation RPC, multi-step Flutter flow with preview and currency confirmation), then reviewed the diffs and tested data integrity with real CSV files and on-device checks before the changes were merged.
- Investigated settlements displaying on the wrong day and guided and validated fixes for timezone handling, rounding bias and currency conversion across Flutter UI, Dart domain logic, Supabase RPCs, migrations and sync.

Education

Bachelor of Science in Computer Science, Minor in Business Studies January 2017 - November 2023

MacEwan University, Edmonton, Alberta
